

'POC in a Week' powered by IMSCAD

We have all 3 Remote Graphics solutions for you to try.

Why build your own POC system, when you can use our tried and tested one?

- Do you have access to all the ISV applications your need to test?
- Publish and manage all your design data for users to test?
- Take away the stress - We charge a fee for our 'POC in a week', we base it around the standard option with up to 5 Apps, with 5 Users for 5 days, with all admin and support included.
- Consulting follow up included to analyse the results
- POC performance - a proven environment that will deliver your users the required level of application and design data performance.

We can also offer you more bespoke POC's for those customers that want more users and Apps for a longer period. This will be priced on a case by case basis.

This a production ready environment that will give your customer a real experience of the power of the solution from the Cloud. We will be happy to share the infrastructure it is run on and happy to help you realise the opportunity after the POC is run.

We can take the stress out of understanding all the workflows, Applications and Infrastructure required to deliver success to a POC.

IMSCAD have a Cloud based AMD - Intel - NVIDIA platform on both Citrix and VMware.

We have servers in the UK and US that deliver excellent performance to ensure your customers get a great POC experience.

We have access to many ISV's software and we allow your customer to upload their own design data to test the solution with real users for a few days.

The process would then move in to a more prolonged pilot phase which we can either support you with or you can run yourself.

No more shipping of hardware to run a POC, speed up the whole process with IMSCAD. The low cost way of proving these technologies will work for your business.
